Where Typhoon Exposure and Rice-Price Volatility Overlap

Stakeholder policy brief | Philippines | 2024-2025

THE QUESTION

Which regions and provinces had both more severe typhoon warnings and larger rice-price increases?

THE MAIN MESSAGE

Some places stand out on both signals and should receive closer monitoring. This analysis identifies where the patterns overlap; **it does not say that typhoons caused rice-price changes.**

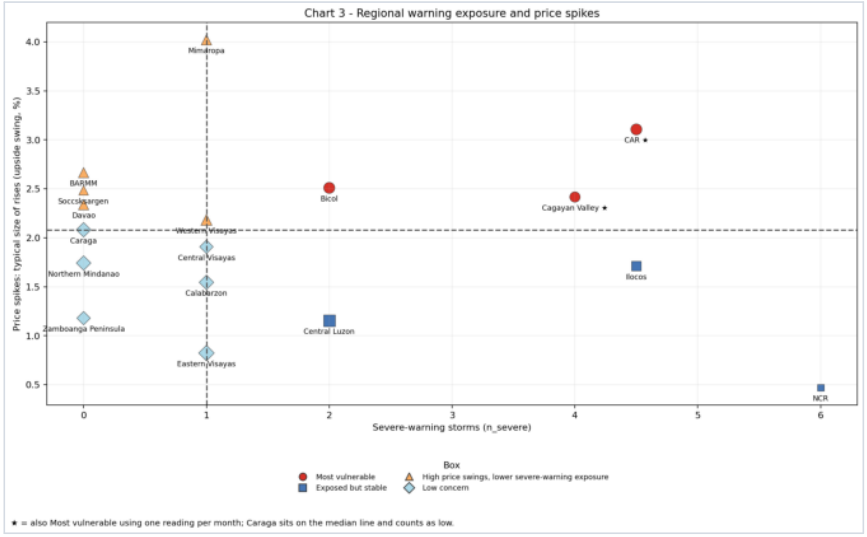
WHAT THE ANALYSIS FOUND

3 regions	Bicol, CAR, and Cagayan Valley stood out in the regional comparison.
12 provinces	above the median on both warning exposure and price swings.
67 of 81	provinces kept the same group in the monthly check (regions: 13 of 17).
75 of 81	provinces had rice prices end lower, but upward movements varied substantially.

HOW TO USE THIS BRIEF

Use the results to prioritize monitoring and decide where to collect more information. Do not use the group labels as proof of damage, household impact, or cause and effect.

REGIONAL COMPARISON



Bicol, CAR, and Cagayan Valley are above both regional medians.

WARNING EXPOSURE

2,717	warning records processed
63	provinces in at least one warning signal
29 of 41	storms with provincial warning listings
28	repeat severe-warning listings across 16 provinces

RICE-PRICE MOVEMENT

- The analysis uses the size of upward price movements.
- Price decreases do not increase the price-swing score.

Five highest province scores

Masbate | **Batangas** | **Marinduque** | **Occidental Mindoro** | **Aurora**

PROVINCES FLAGGED BY THE SCREEN

Abra | **Apayao** | **Aurora** | **Cagayan** | **Camarines Norte** | **Camarines Sur** | **Catanduanes** | **Ifugao** | **Ilocos Sur** | **Isabela** | **Mountain Province** | **Quirino**

RECOMMENDED NEXT STEPS

1. Monitor rice prices in flagged regions during and after severe-weather periods.
2. Check whether transport disruption, supply, market arrivals, or policy changes coincide with price movements.
3. Compare warning exposure with actual damage and household-level food-security indicators.
4. Use the same KPIs on a longer time period as new data become available.

WHAT THIS ANALYSIS CANNOT ESTABLISH

- × A typhoon caused a particular price increase.
- × A warning means a province experienced physical damage.
- × A flagged province was harmed more than another province.
- × The observed overlap excludes other explanations.

Bottom line: the project provides a transparent way to decide where closer observation and better data could be most useful.
